

## **DS\_TUTORIAL-8**

**ADITYA RAJ (U20CS100)**

**B100**

### **ALGORITHMS**

1.

#### **i. Insert in beginning**

1. Start
2. Input the DATA to be inserted
3. Create a new node.
4.  $\text{NewNode} \rightarrow \text{Data} = \text{DATA}$   $\text{NewNode} \rightarrow \text{Lpoint} = \text{NULL}$
5. IF START IS NULL  $\text{NewNode} \rightarrow \text{Rpoint} = \text{NULL}$
6. Else  $\text{NewNode} \rightarrow \text{Rpoint} = \text{START}$ ,  $\text{START} \rightarrow \text{Lpoint} = \text{NewNode}$
7.  $\text{START} = \text{NewNode}$
8. Stop

#### **ii. Inset at last**

1. Start
2. Input DATA to be inserted
3. Create a NewNode
4.  $\text{NewNode} \rightarrow \text{DATA} = \text{DATA}$
5.  $\text{NewNode} \rightarrow \text{RPoint} = \text{NULL}$
6. If (SATRT equal to NULL)
  - a.  $\text{START} = \text{NewNode}$
  - b.  $\text{NewNode} \rightarrow \text{LPoint} = \text{NULL}$
- Else
  - c.  $\text{TEMP} = \text{START}$
  - d. While ( $\text{TEMP} \rightarrow \text{Next}$  not equal to NULL)
    - i.  $\text{TEMP} = \text{TEMP} \rightarrow \text{Next}$
  - e.  $\text{TEMP} \rightarrow \text{RPoint} = \text{NewNode}$
  - f.  $\text{NewNode} \rightarrow \text{LPoint} = \text{TEMP}$
7. Stop

### **iii. Insert at any random location**

1. Start
2. Input the DATA and POS
3. Initialize  $TEMP = START; i = 0$
4. Repeat the step 4 if (i less than POS) and (TEMP is not equal to NULL)
5.  $TEMP = TEMP \rightarrow RPoint; i = i + 1$
6. If (TEMP not equal to NULL) and (i equal to POS)

Create a New Node

- a)  $NewNode \rightarrow DATA = DATA$
- b)  $NewNode \rightarrow RPoint = TEMP \rightarrow RPoint$
- c)  $NewNode \rightarrow LPoint = TEMP$
- d)  $(TEMP \rightarrow RPoint) \rightarrow LPoint = NewNode$
- e)  $TEMP \rightarrow RPoint = New\ Node$

Else

Display "Position NOT found" .

9. Stop.

### **iv. Delete from beginning**

1. Start.
2. If head is equal to NULL

Display underflow.

Else

set head equals head->next.

3. Stop.

### **v. Delete from last**

1. Start.

2. If head is equal to NULL

- a. Display underflow and return.
- b. Else if head->next equals NULL
- c. Set head = NULL.
- d. Free the head.

Else

- e. Set Ptr=head
- f. Repeat steps until ptr->next is not equal to NULL
- g. ptr = ptr->next.
- h. [End of if structure]
- i. ptr = ptr->prev.
- j. ptr->next = NULL.

3. Stop.

#### **vi. Delete node after specified location**

- 1. Start.
- 2. Check for above conditions first and if not true continue.
- 3. Declare a temporary variable temp and traverse with it upto the specified position.
- 4. Declare a pointer prv holding previous position of temp.
- 5. Set prv->next = temp->next.
- 6. Set temp->next->prev = prv.
- 7. Delete the temp.
- 8. Stop.

#### **vii. Search for an element.**

- 1. Start.
- 2. IF HEAD == NULL

- a. WRITE "UNDERFLOW" GOTO STEP 8 [END OF IF]
3. Set PTR = HEAD
4. Set i = 0
5. Repeat step 5 to 7 while PTR != NULL
6. IF PTR → data = item
  1. return i [END OF IF]
7. i = i + 1
8. PTR = PTR → next
9. Stop.
